

RETURN

 **START GAME**

Options

ELEVATOR PITCH

- Roguelike TCG where survival isn't found in just strategy about your cards, but earned through mechanical precision
- You play as Edrick, a fallen warrior navigating a shifting ancestral fortress
- Features a real-time "Parry-to-Play" system
- It's a challenge designed for players who demand strategy paired with aggression, accuracy and skill.

¿WHY A TURN BASED GAME?

- Throughout history there have existed many turn-based games with interesting stories and mechanics, but a very small amount of them make combat feel engaging after a lot of time
- Return has the objective of eliminating boring fights in turn-based like games and providing multiple mechanisms to make fights fun and different

MAIN CHALLENGES WE HAD

Communication

It was difficult to organize team work as each one of us had different abilities and interests

Version control

There were times where someone forgot to pull the changes from the remote repo, or didn't know how to configure the database

Architecture decision

As we had a different vision from what we learned in class, we had difficulties choosing what to implement and how to do it

Mechanic implementation

When designing the mechanics we didn't take into account it would be really difficult to implement them

HOW DID WE SOLVE THEM?

Communication

After a scrum meeting we decided to do daily meetings, have a chat with the product owner and send the updates made in the day

Version control

After communicating updates the functions implemented were tested and merged into main

Architecture decision

After talking with the team we pinpointed the main aspects that were going to be in the game, eliminating unnecessary elements from the game engine

Mechanic implementation

We decomposed the mechanics to the most basic level and added more complicated implementations after the basics were done

LESSONS LEARNED

- Having a defined structure before making a product is really helpful to avoid having to plan while developing
- Communication is necessary, it can help us to balance the workload and ask for help when necessary, avoiding unnecessary issues and fights
- Git must be treated carefully, if something is done wrong it can ruin previous work
- Understanding and working with the current architecture is important, wanting to do changes is alright, but only after making sure they adapt to the work already done

CONCLUSION

Working in random teams was really difficult, as we had to learn how different people work compared to our usual teams. Throughout the project we had to adapt, learn how to use different tools and use agile methodologies. Through this project I was able to develop better programming skills, learn how things are done in the work scene and understand how to communicate with my team. I hope that through these things I will be able to adapt to the work I will have in the future and get even better results.

A watercolor illustration of a mountain landscape. In the background, there are large, jagged mountain peaks rendered in soft, light blue and white washes. The foreground is filled with dark green, conical evergreen trees. Several birds are depicted in flight, their silhouettes rendered in dark brown or black. The overall style is soft and painterly, with a focus on natural elements. The text "THANK YOU" is centered in the middle of the image in a black, serif font.

THANK YOU
